

The image shows a PyCharm IDE with a Python script named `PoundstoDollars.py` and its execution output in the Run console.

Code Editor:

```
1 # 10 Name your file: PoundsToDollars.py Write a program that asks the user to enter an
2 # amount in pounds (£) and the program calculates and converts an amount in dollar ($)
3 # An example runs of the program: Please enter amount in pounds: XXX £ XXX are $ XXX
4 Amount=float(input('Please enter amount in pounds: '))
5 Convert=Amount*1.27 #1 Pound=1.27 dollars
6 print('\u00A3',Amount,'are $',Convert)
```

Run Console:

```
C:\Users\user\PycharmProjects\entri_d41_python_project\.venv\Scripts\python.exe C:\Users\user\PycharmProjects\entri_d41_pytho
Please enter amount in pounds: 1000
£ 1000.0 are $ 1270.0
Process finished with exit code 0
```
